HOW WE CHECKED THE RECEIPTS (PART I: 5-ROUND LIVE INGESTION & SHA-256 LOCK)

Every Y-IT volume executes a multi-round empirical harvest across statutory federal dockets, central bank surveys, peer-reviewed DOI registries, temporal DOM archives, a **12GB Dedicated Local VRAM + Elastic Cloud GPU Compute Array**, and a **Columnar OLAP Statistical Lakehouse**:

HOW WE CHECKED THE RECEIPTS (PART II: CONVERGENT RANGES, 14-MOLD SIEVE & GATES)

← **Continued from Page 58.** Raw records pass through the `RM-10v2` Multi-Source Magnitude Convergence Sieve (requiring ≥3 independent sources of matching magnitude, integrated as a **convergent range + cohort median**), the 13+1 Empirical Failure Mold Census, and 7 Go Compiler Gates (G1–G7):
